

# NetBeans Setup

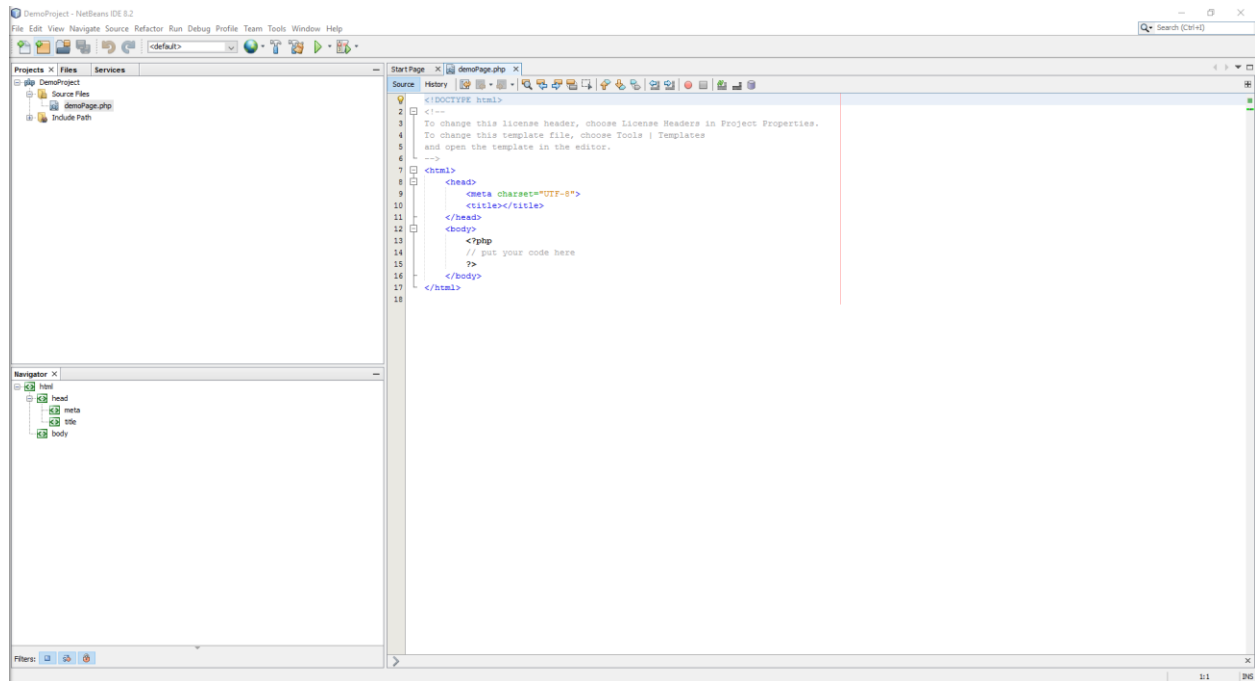

## Create new PHP Application Project

Make sure the source folder location is within the “AppServ\www\” folder on your computer. I created a new folder called “DemoWebsite” within the www folder and the project will be stored there

Leave the details to default. You should be able to access your php webpages using  
localhost/yourfoldername/phpPageName

You can now create new php files within the Source Files in your project directory. I created the php webpage file called “demoPage”, so I can access it using the url (localhost/DemoWebsite/demoPage.php) in a web browser. You should also be able to run it through NetBeans IDE.
